Analysis performed 190604\_160252
Analyzed sequences: 49992 (out of which unclassified: 4765)
Red dotted lines in the tree indicate paraphyletic relationships.
The tree background color indicates the presence of the proteins

The tree background color indicates the presence of the proteins with the corresponding color according to our hypotheses.

The red-to-white background of the table indicates a heuristic reliability of the results, where a brighter color indicates a higher reliability. This is calculated using the number of fully sequenced genomes, the number of species in the phylum and the number of protein sequences available for that phylum.

				calculated using the number of fully sequenced genomes, the number of species in the phylum and the number of pro
