Analysis performed: 190605\_105123
 Analyzed sequences (hits resulting from 676 blast searches, 52 animal groups x 13 query sequences, not uniques!): 49992 (out of which unclassified: 4765).

Red dotted lines in the tree indicate paraphyletic relationships.

The tree background color indicates the presence of the proteins with the corresponding color according to our hypotheses.
The red-to-white background of the table indicates a heuristic reliability of the results, where a brighter color indicates a higher reliability. This is calculated using the number of fully sequenced genomes, the number of species in the phylum and the number of protein sequences available for that phylum.
The numbers in the table denote the number of: orthologs found (black), P = paralogs found, ? = homologs found, whose relationship could not be programmatically determined, Σ = total homologs found.
